

Area of Sector and Segment of a Circle

Page 1 of 2 · Concept summary, formulas and key takeaways

■ The two regions — know the difference

Sector — the region enclosed by **two radii and the arc between them** (a pizza slice). It always contains the **centre**. The angle between the radii, measured at the centre, is θ .

Segment — the region enclosed by a **chord and the arc** joining its endpoints. It need not touch the centre.

*In one line: a sector is cut by two radii, a segment by one chord. Unless stated otherwise, both words mean the **minor** piece.*

■ Core formulas (θ in degrees)

AREA OF A SECTOR

$$\text{Area} = \left(\frac{\theta}{360}\right) \times \pi r^2$$

The whole circle sweeps 360° and has area πr^2 . A sector sweeps only θ° , so it is the fraction $\theta/360$ of the circle.

LENGTH OF AN ARC

$$\text{Arc length} = \left(\frac{\theta}{360}\right) \times 2\pi r$$

The same fraction $\theta/360$, applied to the circumference $2\pi r$. This is a length (cm), not an area.

AREA OF A SEGMENT

$$\text{Segment} = \text{Sector} - \text{Triangle}$$

Area of segment = $\left(\frac{\theta}{360}\right)\pi r^2$ – area of the triangle formed by the two radii and the chord. For $\theta = 90^\circ$ that triangle is right-angled with area $\frac{1}{2}r^2$.

Major piece = whole circle – minor piece, for both sectors and segments. Angle of the major sector = $360^\circ - \theta$.

■ Key takeaways

- Every formula here is the whole circle scaled by $\theta/360$ – nothing else to memorise.
- **Area uses πr^2 , arc length uses $2\pi r$** . Check the units: cm^2 for area, cm for length.
- Use $\pi = 22/7$ when the radius is a multiple of 7, otherwise $\pi = 3.14$ – unless the question specifies.
- Find the smaller piece first, then subtract from πr^2 for the larger one – it saves exam time.

■ Common mistakes that cost marks

- Using πr^2 for a sector and **forgetting the $\theta/360$ factor**.
- Answering with the **sector** when the **segment** was asked – the triangle was never subtracted.
- Taking the major sector's angle as θ instead of $360^\circ - \theta$.

Worked Example — Area of a Minor Segment

Page 2 of 2 · A full solution in exam-answer format

Question. A chord of a circle of radius **10 cm** subtends a **right angle (90°)** at the centre. Find the area of the corresponding **minor segment**. (Use $\pi = 3.14$.)

Solution

- 1 Identify what is asked.** A segment is wanted, so the plan is: sector area first, then subtract the triangle. Given $r = 10$ cm, $\theta = 90^\circ$.
- 2 Area of the sector** $= (\theta/360) \times \pi r^2 = (90/360) \times 3.14 \times 10^2 = \frac{1}{4} \times 3.14 \times 100 = \mathbf{78.5 \text{ cm}^2}$
- 3 Area of the triangle.** The two radii meet at 90° , so triangle OAB is right-angled with both legs equal to r . Area $= \frac{1}{2} \times r \times r = \frac{1}{2} \times 10 \times 10 = \mathbf{50 \text{ cm}^2}$
- 4 Subtract.** Area of the minor segment $= 78.5 - 50$

Area of the minor segment = 28.5 cm²

Check the major segment too: $\pi r^2 - 28.5 = 314 - 28.5 = 285.5 \text{ cm}^2$. The two segments add back to the full circle, which confirms the answer.

Try these next

- Sector of radius 6 cm, $\theta = 60^\circ$, $\pi = 22/7 \rightarrow$ area $132/7 \approx \mathbf{18.86 \text{ cm}^2}$, arc length $44/7 \approx \mathbf{6.29 \text{ cm}}$.
- Same circle: the **major** sector $\approx 113.14 - 18.86 = \mathbf{94.28 \text{ cm}^2}$.
- When $\theta = 60^\circ$ or 120° , the triangle needs trigonometry — area $= \frac{1}{2}r^2 \sin \theta$, using $\sqrt{3} \approx 1.73$. That is where most segment questions get hard.

Stop re-reading. Start practising.

Formulas stick when you use them under exam conditions and see exactly where you slipped. That is what examfront is built for.

- ▶ **Chapter 1 is completely free** — start today, no payment needed
- ▶ **Mistake identification** — see the exact step where each answer went wrong
- ▶ **Anytime tests** — practise any chapter, any topic, whenever you sit down
- ▶ **Weekly tests** — steady revision so nothing piles up before the boards
- ▶ **Full mock tests before the exam** — real paper pattern, real timing
